

Bayescoverage APP - subnational overview

Leontine Alkema, last updated June 12, 2026

Installation info is given in the readme and shinyapp

```
library(bayescoveragedeploy)
```

Where data are stored:

```
data_folder <- "data_raw" # for survey data
routinedata_dir <- here::here("private/routinedata/")
# see note on working with routine dummy data below
```

Choose an indicator. Naming comes from survey data, options include

- c("anc1trimester", "vmsl", "ideliv", "vdpt", "anc4") , with routine as available
- c("bfexcl0_5", "ancq8", "cci", "sba"), no routine data

NOTE JUNE 12: ONLY CCI and ANC4 can be used right now

```
indicator_select <- "anc4" #"cci"
```

Read in survey data and process

```
dat0 <- haven::read_dta(here::here(data_folder, "ICEH_gregion_20260611.dta")) |>
  dplyr::rename(r = r_raw, se = se_raw, , admin1 = "level")
```

If relevant, LA added code to clean the 6/11 data set to only keep only years with same regional structure as most recent year (as some countries have different regions for different surveys).

Copying here in quarto but not used.

```

# Filter to
# For each iso-indic combination:
# 1. Find the most recent year
# 2. Get the unique regions in that year
# 3. Keep only years where regions match the most recent year
dat1 <- dat0 |>
  dplyr::group_by(iso, indic) |>
  dplyr::mutate(
    max_year = max(year, na.rm = TRUE)
  ) |>
  dplyr::group_by(iso, indic, year) |>
  dplyr::mutate(
    regions_this_year = paste(sort(unique(admin1)), collapse = "|")
  ) |>
  dplyr::group_by(iso, indic) |>
  dplyr::mutate(
    regions_max_year = regions_this_year[year == max_year][1]
  ) |>
  dplyr::filter(regions_this_year == regions_max_year) |>
  dplyr::select(-max_year, -regions_this_year, -regions_max_year) |>
  dplyr::ungroup()

```

Fitting for 1 or more regions in one country, use ISO to select

```

# countries with survey data
# unique(dat$iso)
iso_select <- "NGA"
dat_use <-
  bayescoveragemodel::process_data(
    dat = dat0 |>
    dplyr::filter(iso %in% iso_select),
    regions_dat = bayescoveragemodel::regions_all,
    indicator = indicator_select, verbose = FALSE)

```

```
[1] "Column possible_outlier not included in data, no pre-defined outliers used"
```

```

# regions
admin1s <- sort(unique(dat_use$admin1))
admin1s

```

```
[1] "Abia"           "Abuja FCT"      "Adamawa"         "Akwa ibom"
```

[5]	"Akwa Ibom"	"Akwa-Ibom"	"Anambra"	"Bauchi"
[9]	"Bayelsa"	"Benue"	"Borno"	"Cross River"
[13]	"Cross-River"	"Delta"	"Ebonyi"	"Edo"
[17]	"Ekiti"	"Enugu"	"FCT"	"FCT (Abuja)"
[21]	"FCT Abuja"	"FCT-Abuja"	"Gombe"	"Imo"
[25]	"Jigawa"	"Kaduna"	"Kano"	"Katsina"
[29]	"Kebbi"	"Kogi"	"Kwara"	"Lagos"
[33]	"Nasarawa"	"Niger"	"North central"	"North Central"
[37]	"North east"	"North East"	"North west"	"North West"
[41]	"North-Central"	"North-East"	"North-West"	"Ogun"
[45]	"Ondo"	"Osun"	"Oyo"	"Plateau"
[49]	"Rivers"	"Sokoto"	"South east"	"South East"
[53]	"South south"	"South South"	"South west"	"South West"
[57]	"South-East"	"South-South"	"South-West"	"Taraba"
[61]	"Yobe"	"Zamfara"		

Do we want to add routine data?

```
add_routine <- ifelse(
  indicator_select %in% c("anc1trimester", "vmsl", "ideliv", "vdpt", "anc4"),
  TRUE,
  FALSE)
add_routine
```

```
[1] TRUE
```

If yes, read in routine data. Make sure it has an admin1 column with admin1 names that match the survey data. DO NOT include an iso column in the routine data set.

```
if (!add_routine){
  routine_dat <- routine_dat_use <- NULL
} else {
  # use dummy data, need
  routine_dat_use <- readr::read_csv(here::here("data_raw/routine_toydata.csv")) |>
  # add admin1 column with matching names to dat_use
  dplyr::mutate(admin1 = admin1s[1],
                indicator_name = indicator_select) |>
  dplyr::select(-iso)
}
```

```

Rows: 5 Columns: 5
-- Column specification -----
Delimiter: ","
dbl (3): year, routine_value, countdownmean
lgl (2): iso, indicator_name

i Use `spec()` to retrieve the full column specification for this data.
i Specify the column types or set `show_col_types = FALSE` to quiet this message.

```

```
routine_dat_use
```

```

# A tibble: 5 x 5
  indicator_name year routine_value countdownmean admin1
  <chr>          <dbl>         <dbl>         <dbl> <chr>
1 anc4          2020           0.52           95 Abia
2 anc4          2021           0.53          100 Abia
3 anc4          2022           0.55          100 Abia
4 anc4          2023           0.52          100 Abia
5 anc4          2024           0.56          100 Abia

```

```

# or use a dummy set as follows:
# routine_dat_use <- data.frame(
#   iso = rep(iso_select, 3),
#   year = 2021:2023,
#   indicator_name = indicator_select,
#   routine_value = c(0.85, 0.87, 0.90),
#   countdownmean = rep(100, 3))

```

make sure to use the “subnational = TRUE” argument to fit the model

```

fit <- bayescoveredeploy::fit_local_model(
  survey_df = dat_use,
  subnational = TRUE,
  indicator = indicator_select,
  iso_select = iso_select,
  routine_df = routine_dat_use
)

Chain 1:

Warning: There were 5 divergent transitions after warmup. See <https://mc-stan.org/misc/warnings.html#divergent-transitions-after-warmup> to find out why this is a problem and how to eliminate them.

Warning: Examine the pairs() plot to diagnose sampling problems

Warning: The largest R-hat is NA, indicating chains have not mixed. Running the chains for more iterations may help. See <https://mc-stan.org/misc/warnings.html#r-hat>

Warning: Bulk Effective Samples Size (ESS) is too low, indicating posterior means and medians. Running the chains for more iterations may help. See <https://mc-stan.org/misc/warnings.html#bulk-ess>

Warning: Tail Effective Samples Size (ESS) is too low, indicating posterior variances and tails. Running the chains for more iterations may help. See <https://mc-stan.org/misc/warnings.html#tail-ess>

[1] "We fix all sigmas of hierarchical models."
[1] "We take the data model setting from global fit."
[1] "We add smoothing"
[1] "We fix smoothing and data model parameters."
[1] "TMP solution: we do a subnational run but we set subational to false to not deal with a"
[1] "We use subnational data."
[1] "We do NOT add subnational correlation."
[1] "We filter data to be inside estimation period"
[1] "We use subnational data (but you already knew that)"
[1] "We only use data for NGA"
[1] "NOT using or producing aggregates"
[1] "Using precompiled Stan model"
```

SAMPLING FOR MODEL 'fpem' NOW (CHAIN 1).

Chain 1:

Chain 1: Gradient evaluation took 0.00011 seconds

Chain 1: 1000 transitions using 10 leapfrog steps per transition would take 1.1 seconds.

Chain 1: Adjust your expectations accordingly!

Chain 1:

Chain 1:

Chain 1: Iteration: 1 / 450 [0%] (Warmup)

Chain 1: Iteration: 10 / 450 [2%] (Warmup)

SAMPLING FOR MODEL 'fpem' NOW (CHAIN 2).

Chain 2:

Chain 2: Gradient evaluation took 8.5e-05 seconds

Chain 2: 1000 transitions using 10 leapfrog steps per transition would take 0.85 seconds.

Chain 2: Adjust your expectations accordingly!

Chain 2:

Chain 2:

Chain 2: Iteration: 1 / 450 [0%] (Warmup)

Chain 1: Iteration: 20 / 450 [4%] (Warmup)

Chain 2: Iteration: 10 / 450 [2%] (Warmup)

Chain 1: Iteration: 30 / 450 [6%] (Warmup)

Chain 1: Iteration: 40 / 450 [8%] (Warmup)

Chain 2: Iteration: 20 / 450 [4%] (Warmup)

SAMPLING FOR MODEL 'fpem' NOW (CHAIN 3).

Chain 1: Iteration: 50 / 450 [11%] (Warmup)

Chain 2: Iteration: 30 / 450 [6%] (Warmup)

Chain 1: Iteration: 60 / 450 [13%] (Warmup)

Chain 1: Iteration: 70 / 450 [15%] (Warmup)

SAMPLING FOR MODEL 'fpem' NOW (CHAIN 4).

Chain 4:

Chain 4: Gradient evaluation took 7.3e-05 seconds

Chain 4: 1000 transitions using 10 leapfrog steps per transition would take 0.73 seconds.

Chain 4: Adjust your expectations accordingly!

Chain 4:

Chain 4:

Chain 2: Iteration: 40 / 450 [8%] (Warmup)

Chain 3: Chain 4: Iteration: 1 / 450 [0%] (Warmup)

Chain 3: Gradient evaluation took 6.7e-05 seconds

Chain 3: 1000 transitions using 10 leapfrog steps per transition would take 0.67 seconds.

Chain 3: Adjust your expectations accordingly!
